

# DEDEKIND’S CRITERION AND INTEGRAL BASES

LHOUSSAIN EL FADIL

Dept. of Math., Fac. of Sci. Dhar- El Mahraz, Sidi Mohamed Ben Abdellah University, Atlas-Fez, MOROCCO

ABSTRACT. Let  $R$  be a principal ideal domain with quotient field  $K$ , and  $L = K(\alpha)$ , where  $\alpha$  is a root of a monic irreducible polynomial  $F(x) \in R[x]$ . Let  $\mathbb{Z}_L$  be the integral closure of  $R$  in  $L$ . In this paper, for every prime  $p$  of  $R$ , we give a new efficient version of Dedekind’s criterion in  $R$ , i.e., necessary and sufficient conditions on  $F(x)$  to have  $p$  not dividing the index  $[\mathbb{Z}_L : R[\alpha]]$ , for every prime  $p$  of  $R$ . Some computational examples are given for  $R = \mathbb{Z}$ .

## 1. Introduction

Throughout this paper unless otherwise stated,  $R$  is a principal ideal domain with quotient field  $K$ . For every prime element  $p$  of  $R$ , let  $\nu_p$  be the  $p$ -adic discrete valuation on  $R$  and  $k(p) = \frac{R}{(p)}$  the residue field associated to  $p$ . The Gaussian valuation of  $K(x)$  which extends  $\nu_p$  and defined by

$$\nu_p \left( \sum_{i=0}^l a_i X^{l-i} \right) = \min \{ \nu_p(a_i), 0 \leq i \leq l \} \quad \text{is also denoted by } \nu_p.$$

Let  $L = K(\alpha)$ , where  $\alpha$  is a root of a monic irreducible polynomial  $F(x) \in R[x]$ . Let  $\text{disc}(F)$  be the discriminant of  $F$ ,  $\mathbb{Z}_L$  the integral closure of  $R$  in  $L$ , and  $\text{ind}(\alpha) = [\mathbb{Z}_L : R[\alpha]]$  the index of  $R[\alpha]$  in  $\mathbb{Z}_L$ . A natural question is: when does  $\mathbb{Z}_L = R[\alpha]$ ? If  $R = \mathbb{Z}$ , then for every prime integer  $p$ , Dedekind gave a criterion to test whether or not  $p$  divides  $\text{ind}(\alpha)$ ; more precisely, he proved that  $p$  does not divide  $\text{ind}(\alpha)$  if and only if for every  $i = 1, \dots, r$ , either  $e_i = 1$  or  $e_i \geq 2$  and  $\overline{\phi}_i(x)$  does not divide  $\overline{M}(x)$ , where

$$M(x) = \frac{F(x) - \prod_{j=1}^r \phi_j^{l_j}(x)}{p} \quad \text{and} \quad \overline{F}(x) = \prod_{j=1}^r \overline{\phi}_j^{l_j}(x) \pmod{p}$$

is the factorization of  $\overline{F}(x)$  in  $\mathbb{F}_p[x]$  (see [5] Theorem 6.1.4) and [8]).

This criterion was also proved over any valuation ring  $R$  and any algebraic field extension  $L = K(\alpha)$  of  $K$ , where  $L/K$  is not necessarily separable [7]. In this paper, we give a more efficient version of this criterion for any principal ideal domain  $R$  with no separability assumption on the extension  $L/K$ . We further give some computational examples in the case  $R = \mathbb{Z}$ .

## 2. Main results

We recall here the definition of the index  $\text{ind}(\alpha) = [\mathbb{Z}_L : R[\alpha]]$ . Since  $R$  is a principal ideal domain,  $\mathbb{Z}_L$  is a free  $R$ -module of rank  $n = \deg(F)$ . Let  $\mathbf{B} = \{u_1, \dots, u_n\}$  be an  $R$ -basis of  $\mathbb{Z}_L$  and  $P_B^F$  the transition matrix from  $\mathbf{B}$  to the  $R$ -basis  $\mathbf{F} = \{1, \alpha, \dots, \alpha^{n-1}\}$  of  $R[\alpha]$ . The index  $[\mathbb{Z}_L : R[\alpha]]$  is the principal ideal of  $R$  generated by the determinant of  $P_B^F$ . It is well known that this principal ideal  $[\mathbb{Z}_L : R[\alpha]]$  is well defined and is independent on the choice of the bases  $\mathbf{B}$  and  $\mathbf{F}$  of  $\mathbb{Z}_L$  and  $R[\alpha]$ , respectively. Since  $R$  is a principal ideal domain, it follows from the invariant factor Theorem that there exists  $\mathbf{B} = \{u_1, \dots, u_n\}$  an  $R$ -basis of  $\mathbb{Z}_L$  and  $(q_1, \dots, q_n) \in R^n$  such that for every  $i = 1, \dots, n-1$ ,  $q_i$  divides  $q_{i+1}$ , and  $\mathbf{F} = \{q_1 u_1, \dots, q_n u_n\}$  is an  $R$ -basis of  $R[\alpha]$ . Since  $P_B^F$  is the diagonal matrix with diagonal elements:  $q_1, \dots, q_n$ , the index  $[\mathbb{Z}_L : R[\alpha]]$  is then precisely the principal ideal of  $R$  generated by  $\prod_{i=1}^n q_i$ . If  $R = \mathbb{Z}$ , then  $\text{ind}(\alpha)$  is the cardinal order of the finite group  $\mathbb{Z}_L/\mathbb{Z}[\alpha]$ .

In this section, let

$$F(x) \equiv \prod_{i=1}^r \phi_i^{l_i}(x) \pmod{p}$$

be the factorization of  $\overline{F}(x)$  in  $k(p)[x]$ , where for every  $i := 1, \dots, r$ ,  $\phi_i$  is a monic polynomial in  $R[x]$ . For every  $i := 1, \dots, r$ , let  $Q_i(x)$  and  $R_i(x)$  be the quotient and the remainder of the Euclidean division of  $F(x)$  by  $\phi_i(x)$ , respectively.

Our next Theorem computationally improves the well known Dedekind's criterion.

**THEOREM 2.1.** *Under the above hypotheses,  $p$  does not divide the index  $[\mathbb{Z}_L : R[\alpha]]$  if and only if for every  $i := 1, \dots, r$ , either  $l_i = 1$  or  $l_i \geq 2$  and  $\nu_p(R_i(x)) = 1$ .*

*Proof.* If for every  $i := 1, \dots, r$ ,  $l_i = 1$ , then by the generalized Dedekind's criterion  $p$  does not divide  $\text{ind}(\alpha)$  (see for example [7]). Otherwise, let

$$M(x) = \frac{F(x) - \prod_{j=1}^r \phi_j^{l_j}(x)}{p}$$

as defined in the Dedekind's criterion and let us show that for every  $i = 1, \dots, r$ , with  $l_i \geq 2$ ,  $\nu_p(R_i(x)) = 1$  if and only if  $\overline{\phi}_i$  does not divide  $\overline{M}(x)$  in  $k(p)[x]$ .

Indeed, as

$$F(x) \equiv \prod_{j=1}^r \phi_j^{l_j}(x) \pmod{p},$$

then  $\overline{\phi_i}(x)$  divides

$$\overline{F}(x), \quad \overline{R_i}(x) = \overline{0} \pmod{p} \quad \text{and} \quad \overline{Q_i}(x) = \overline{\phi_i^{l_i-1}(x) \prod_{j \neq i} \phi_j^{l_j}} \pmod{p}.$$

Thus there exists some  $H_i(x) \in R[x]$  such that

$$Q_i(x) = \phi_i^{l_i-1}(x) \prod_{j \neq i} \phi_j^{l_j}(x) + pH_i(x).$$

Therefore,

$$F(x) = \left( \phi_i^{l_i-1}(x) \prod_{j \neq i} \phi_j^{l_j}(x) + pH_i(x) \right) \phi_i(x) + R_i(x)$$

and

$$M(x) = \frac{F(x) - \prod_{j=1}^r \phi_j^{l_j}(x)}{p} = H_i(x)\phi_i(x) + \frac{R_i(x)}{p}.$$

It follows that  $\overline{\phi_i}$  does not divide  $\overline{M}(x)$  in  $k(p)[x]$  if and only if  $\frac{R_i(x)}{p} \not\equiv 0 \pmod{p}$ .

That is  $\nu_p(R_i(x)) = 1$ .  $\square$

**COROLLARY 2.2.** *If  $R$  is a discrete valuation ring with maximal ideal  $(p)$ , then the equality  $\mathbb{Z}_L = R[\alpha]$  holds if and only if for every  $i := 1, \dots, r$ , either  $l_i = 1$  or  $l_i \geq 2$  and  $\nu_p(R_i(x)) = 1$ .*

**COROLLARY 2.3.** *Under the hypotheses of theorem 2.1, if  $R$  is a Dedekind domain, then for every prime ideal  $\mathfrak{p}$  of  $R$ ,  $\mathfrak{p}$  does not divide the index  $[\mathbb{Z}_L : R[\alpha]]$  if and only if for every  $i := 1, \dots, r$ , either  $l_i = 1$  or  $l_i \geq 2$  and  $R_i(x) \in \mathfrak{p}[X] - \mathfrak{p}^2[X]$ .*

**Remark.** A similar result holds with applications in more general rings, namely Prüfer domains (cf. [9]). In This work, we are interested in another way, namely computation of integral bases.

**THEOREM 2.4.** *Let  $L = K(\alpha)$ , where  $\alpha$  is any root of  $F(x) = \phi(x)^n - a \in R[x]$  such that  $\nu_p(a)$  and  $n$  are coprime and  $\phi(x) \in R[x]$  is a monic polynomial whose reduction modulo  $p$  is irreducible. Then  $\{\alpha^i \theta^j, 0 \leq i < m-1$  and  $0 \leq j < n-1\}$  is a  $p$ -integral basis of  $\mathbb{Z}_L$ , where  $m = \deg(\phi)$ ,  $\theta = \frac{\phi(\alpha)^u}{p^v}$ ,  $u$  and  $v$  are non-negative integers satisfying  $\nu_p(a)u - nv = 1$  such that  $0 \leq u < n$ .*

**Proof.** First,  $L = F(\alpha)$ , where  $F = K(\phi(\alpha))$ ,  $g(x) = x^n - a$  is the minimal polynomial of  $\phi(\alpha)$  over  $K$ , and  $h(x) = \phi(x) - \phi(\alpha)$  is the minimal polynomial of  $\alpha$  over  $F$ . As  $\nu_p(a)$  and  $n$  are coprime, using the Euclid's algorithm, there exists a unique solution of non-negative integers  $(u, v)$  of  $\nu_p(a)u - nv = 1$

such that  $0 \leq u < n$ . Consider  $g_1(x) = x^n - \frac{a^u}{p^{nv}}$ . Then  $g_1(x) \in R[x]$  and  $g_1(\theta) = 0$ . Since  $\nu_p(\frac{a^u}{p^{nv}}) = \nu_p(a)u - nv = 1$ , by Eisenstein's criterion  $g_1(x)$  is irreducible in  $R[x]$ . By Theorem 2.1,  $p$  does not divide the index  $[\mathbb{Z}_F = R[\theta]]$ ;  $\{\theta^j, 0 \leq j < n-1\}$  is a  $p$ -integral basis of  $\mathbb{Z}_F$  over  $R$ . Thus  $p\mathbb{Z}_F = \mathfrak{p}^n$ , where  $\mathfrak{p} = (p, \theta)$ . As  $\bar{h}(x) = \bar{\phi}(x) \pmod{\mathfrak{p}}$ ,  $\bar{\phi}(x)$  is irreducible over  $k(p)$ , and  $f(\mathfrak{p}/p) = 1$ ;  $k(\mathfrak{p}) = k(p)$ , we have  $\bar{h}(x) = \bar{\phi}(x)$  is irreducible over  $k(\mathfrak{p})$ . Again by Theorem 2.1,

$$[\mathbb{Z}_L = \mathbb{Z}_F[\alpha]] \not\subset \mathfrak{p}; \quad \{\alpha^i, 0 \leq i < m-1\}$$

is a  $\mathfrak{p}$ -integral basis of  $\mathbb{Z}_L$  over  $\mathbb{Z}_F$ , where  $m = \deg(\phi)$ . Finally,

$$\{\alpha^i \theta^j, 0 \leq i < m-1 \text{ and } 0 \leq j < n-1\}$$

is a  $p$ -integral basis of  $\mathbb{Z}_L$  over  $R$ . □

In particular, if  $\phi(x) = x$ , then we have the following corollaries:

**COROLLARY 2.5.** *Let  $p$  be a prime of  $R$ ,  $L = K(\alpha)$ , where  $\alpha$  is a root of an irreducible polynomial  $F(x) = x^n - a \in R[x]$  such that  $\nu_p(a)$  and  $n$  are coprime. Let  $\theta = \frac{\alpha^u}{p^v}$ , where  $u$  and  $v$  are the unique non-negative integers satisfying  $\nu_p(a)u - nv = 1$  and  $0 \leq u < n$ . Then  $p$  does not divide the index  $[\mathbb{Z}_L : R[\theta]]$ .*

For any element  $\theta \in \mathbb{Z}_L$ , we say that  $\theta$  generates a power integral basis of  $\mathbb{Z}_L$  over  $R$  if  $(1, \theta, \dots, \theta^{n-1})$  is a  $R$ -basis of  $\mathbb{Z}_L$ , where  $n$  is the degree  $[L : K]$ ;  $\mathbb{Z}_L = R[\theta]$ . When a field  $L$  has a power integral basis, the field  $L$  is said to be monogenic. It is called a problem of Hasse to characterize whether the ring of integers in an algebraic number field has a power integral basis or does not [1–3]. The following corollaries give a condition on  $a$  in order to have the monogeneses of any field  $L$  defined by  $F(x) = x^n - a$ .

**COROLLARY 2.6.** *Keep the assumptions and notations of Corollary 2.5, if  $R$  is a discrete valuation ring with maximal ideal  $(p)$ , then  $\mathbb{Z}_L = R[\theta]$ , where  $\theta = \frac{\alpha^u}{p^v}$  and  $\alpha$  is a root of  $F(x) = x^n - a$ . We say that  $\theta$  generates a power integral basis of  $\mathbb{Z}_L$  over  $R$ .*

**COROLLARY 2.7.** *Let  $L = \mathbb{Q}(\alpha)$  be a pure prime number field;  $\alpha$  a complex root of an irreducible polynomial  $F(x) = x^p - a \in \mathbb{Z}[x]$ , where  $p$  is an odd prime. Assume that  $a = m^e$  with  $0 < e < p$  and let  $\theta = \frac{\alpha^u}{m^v}$ , where  $u$  and  $v$  are the unique non-negative integers satisfying  $eu - nv = 1$  and  $0 \leq u < n$ . Then we have the following:*

- (1) *If  $p$  divides  $m$  or  $p$  does not divide  $m$  and  $\nu_p(m^{p-1} - 1) = 1$ , then  $\mathbb{Z}_L$  is monogenic. Especially  $\mathbb{Z}_L = \mathbb{Z}[\theta]$ .*
- (2) *If  $p$  does not divide  $m$  and  $\nu_p(m^{p-1} - 1) \geq 2$ , then  $(1, \theta, \dots, \theta^{p-2}, \frac{\theta^{p-1}}{p})$  is an integral basis of  $\mathbb{Z}_L$ .*

**THEOREM 2.8.** *Let  $L = \mathbb{Q}(\alpha)$  be a pure prime number field;  $\alpha$  is a complex root of an irreducible polynomial  $F(x) = x^p - a \in \mathbb{Z}[x]$ , where  $p$  is an odd prime. We can assume that  $\nu_q(a) < p$  for every prime integer  $q$ ; set  $a = \mp \prod_{i=1}^r p_i^{e_i}$  the factorization of  $a$  into powers of positive prime integers such that for every  $i = 1, \dots, r$ ,  $e_i < p$ . Then we have the following:*

(1) *If  $p$  divides  $a$  or  $p$  does not divide  $a$  and  $\nu_p(a^{p-1} - 1) = 1$ , then*

$$\left( \frac{\alpha^k}{\prod_{i=1}^r p_i^{\lfloor \frac{ke_i}{p} \rfloor}}, 0 \leq k < p \right) \quad \text{is a } \mathbb{Z}\text{-integral basis of } \mathbb{Z}_L.$$

(2) *If  $p$  does not divide  $a$  and  $\nu_p(a^{p-1} - 1) \geq 2$ , then*

$$\left\{ \frac{\alpha^k}{\prod_{i=1}^r p_i^{\lfloor \frac{ke_i}{p} \rfloor}}, 0 \leq k < p-1 \right\} \cup \left\{ \frac{\alpha^{p-1}}{p \prod_{i=1}^r p_i^{\lfloor \frac{(p-1)e_i}{p} \rfloor}} \right\}$$

*is a  $\mathbb{Z}$ -integral basis of  $\mathbb{Z}_L$ .*

**PROOF.** (1) We have to check that for every positive prime integer  $q$  dividing  $\text{disc}(F) = \mp p^p \cdot a^{p-1}$ , if  $q$  does not divide the index  $[\mathbb{Z}_L : \mathbb{Z}[\theta]]$ . Let  $p_i$  be a prime integer dividing  $a$ . Then  $\overline{F}(x) = x^p \pmod{p_i}$ , the Newton polygon  $N_x(F) = S$  is one sided of slope  $e_i/p$ , and its attached residual polynomial is  $F_S(y)$  is of degree 1 (because  $\gcd(l(S), h(S)) = 1$ , where  $l(S)$  and  $h(S)$  are the length and the height of  $S$ , respectively). Thus, by [6, Prop 2.1],

$$\left( \left\{ \frac{\alpha^k}{p_i^{\lfloor \frac{ke_i}{p} \rfloor}} \right\}, 0 \leq k < p \right) \quad \text{is a } p_i\text{-integral basis of } \mathbb{Z}_L.$$

If  $p$  does not divide  $a$  and  $\nu_p(a^{p-1} - 1) = 1$ , then  $\overline{F}(x) = (x - a)^p \pmod{p}$ . Let

$$H(x) = F(x + a) = x^p + \dots + pa^{p-1}x + a^p - a.$$

Then

$$\overline{H}(x) = x^p \pmod{p}.$$

As  $a^p - a$  is the remainder of  $H(x)$  by  $x$  and  $\nu_p(a^{p-1} - 1) = 1$ , by Theorem 2.1,  $q$  does not divide the index  $[\mathbb{Z}_L : \mathbb{Z}[\alpha]]$ .

(2) If  $p$  does not divide  $a$  and  $\nu_p(a^{p-1} - 1) \geq 2$ , then  $\overline{H}(x) = x^p \pmod{p}$  and its  $x$ -Newton polygon

$$N_x(H) = S_1 + S_2,$$

where  $S_1$  is of height 1 and  $S_2$  is of length 1. Thus [6, Prop 2.1],

$$\left( 1, \alpha, \dots, \alpha^{p-2}, \frac{\alpha^{p-1}}{p} \right) \quad \text{is a } p\text{-integral basis of } \mathbb{Z}_L. \quad \square$$

### 3. Examples

(1) Let

$$F(x) = x^{16} + 8x^{15} + 20x^{14} - 70x^{12} - 56x^{11} + 112x^{10} + 120x^9 \\ - 125x^8 - 120x^7 + 112x^6 + 56x^5 - 70x^4 + 20x^2 - 8x - 7.$$

Since

$$F(x) = (x^2 + x - 1)^8 - 8, \quad \overline{\phi}(x) = \overline{x^2 + x - 1} \pmod{2}$$

is irreducible in  $\mathbb{F}_2[x]$ , and  $\nu_2(8)$  is coprime to 8, by [4, Theorem 1.6],  $F(x)$  is irreducible over  $\mathbb{Q}$ . Let  $\alpha$  be a complex root of  $F(x)$  and  $L = \mathbb{Q}(\alpha)$ . Since

$$\text{disc}(F(x)) = \mp 2^{90} \cdot 73 \cdot 1831, \quad \text{for every prime integer } p \neq 2,$$

$p$  does not divide  $\text{ind}(\alpha)$ . For  $p = 2$ , let  $\theta = \frac{\alpha^3}{2}$ . Then

$$(1, \theta, \dots, \theta^7, \alpha, \alpha\theta, \dots, \alpha\theta^7) \quad \text{is an integral basis of } \mathbb{Z}_L.$$

(2) Let

$$F(x) = x^{16} + 8x^{15} + 20x^{14} - 70x^{12} - 56x^{11} + 112x^{10} + 120x^9 \\ - 125x^8 - 120x^7 + 112x^6 + 56x^5 - 70x^4 + 20x^2 - 8x - 23.$$

Since

$$F(x) = (x^2 + x - 1)^8 - 24,$$

it is a 3-Eisenstein polynomial. So it is irreducible over  $\mathbb{Q}$ . Let  $\alpha$  be a complex root of  $F(x)$  and  $L = \mathbb{Q}(\alpha)$ . Since  $\text{disc}(F(x)) = \mp 2^{90} \cdot 3^{14} \cdot 163 \cdot 7253$ , for every prime integer  $q \notin \{2, 3\}$ ,  $q$  does not divide  $\text{ind}(\alpha)$ . For  $p = 2$ , let  $\theta = \frac{\alpha^3}{2}$ . Then 2 does not divide  $[\mathbb{Z}_L : \mathbb{Z}[\theta]]$ . For  $p = 3$ , since  $\nu_3(24) = 1$ , 3 does not divide  $[\mathbb{Z}_L : \mathbb{Z}[\alpha]]$ .

(3) Let  $p$  be a non-negative prime integer,  $F(x) = x^p - a \in \mathbb{Z}[x]$  an irreducible polynomial,  $\alpha$  a complex root of  $F(x)$ , and  $L = \mathbb{Q}(\alpha)$ .

(a) For  $p = 5$  and  $a = 22^2$ , let  $\theta = \frac{\alpha^4}{22^3}$ . Then for every prime integer  $q \notin \{2, 5, 11\}$ ,  $q$  does not divide  $\text{ind}(\alpha)$ . For  $q \in \{2, 11\}$ ,  $q$  does not divide  $\text{ind}(\theta)$ , too. For  $p = 5$ , since  $v_5(22^4 - 1) = 1$ ,  $v_5(\text{ind}(\theta)) = 0$ . Thus  $\mathbb{Z}_L$  is monogenic, with  $\theta = \frac{\alpha^4}{22^3}$  generating a power integral basis.

(b) Let  $p = 11$  and  $a = 23^6 \cdot 11^5$ . Since  $\text{disc}(F) = \pm 11^{11} a^{10}$ , for every prime  $q \notin \{2, 3, 11\}$ ,  $p$  does not divide  $\text{disc}(F)$ .

DEDEKIND'S CRITERION AND INTEGRAL BASES

$$E = \left\{ 1, \alpha, \alpha^2, \frac{\alpha^3}{11}, \frac{\alpha^4}{11}, \frac{\alpha^5}{11^2}, \frac{\alpha^6}{11^2}, \frac{\alpha^7}{11^3}, \frac{\alpha^8}{11^3}, \frac{\alpha^9}{11^4}, \frac{\alpha^{10}}{11^4} \right\}$$

is an 11-integral basis of  $\mathbb{Z}_L$ , i.e., 11 does not divide the index  $[\mathbb{Z}_L : S]$ , where  $S$  is the  $\mathbb{Z}$ -order generated by  $E$ . Similarly, by using  $\theta = \frac{\alpha^2}{3}$ , we get

$$T = \left\{ 1, \alpha, \frac{\alpha^2}{3}, \frac{\alpha^3}{3}, \frac{\alpha^4}{3^2}, \frac{\alpha^5}{3^2}, \frac{\alpha^6}{3^3}, \frac{\alpha^7}{3^3}, \frac{\alpha^8}{3^4}, \frac{\alpha^9}{3^4}, \frac{\alpha^{10}}{3^5} \right\}$$

as a 3-integral basis of  $\mathbb{Z}_L$ .

Thus,

$$B = \left\{ 1, \alpha, \frac{\alpha^2}{3}, \frac{\alpha^3}{3 \cdot 11}, \frac{\alpha^4}{3^2 \cdot 11}, \frac{\alpha^5}{3^2 \cdot 11^2}, \frac{\alpha^6}{3^3 \cdot 11^2}, \frac{\alpha^7}{3^3 \cdot 11^3}, \frac{\alpha^8}{3^4 \cdot 11^3}, \frac{\alpha^9}{3^4 \cdot 11^4}, \frac{\alpha^{10}}{3^5 \cdot 11^4} \right\}$$

is an integral basis of  $\mathbb{Z}_L$ .

- (c) Let  $p = 11$  and  $a = 3^6$ . Then  $\text{disc}(F) = \pm 11^{11} 3^{60}$ . For  $q \notin \{3, 11\}$ ,  $q$  does not divide  $\text{ind}(\alpha)$ . Then

$$\left\{ 1, \alpha, \frac{\alpha^2}{3}, \frac{\alpha^3}{3}, \frac{\alpha^4}{3^2}, \frac{\alpha^5}{3^2}, \frac{\alpha^6}{3^3}, \frac{\alpha^7}{3^3}, \frac{\alpha^8}{3^4}, \frac{\alpha^9}{3^4}, \frac{(\alpha - 3^6)^{10}}{11 \cdot 3^5} \right\}$$

is an integral basis of  $\mathbb{Z}_L$ .
