

Alien plants of the Podilski Tovtry National Nature Park (Ukraine)

Lyudmila G. Lyubinska

O. V. Fomin Botanical Garden of Taras Shevchenko Kyiv National University, Komintern 1, 01601 Kyiv; Podilsky Tovtry National Nature Park, Polskyi Rynok 6, 32300 Kamyanets-Podilsky, Ukraine, e-mail: skilub@mail.ru

Abstract: The results of a study on alien plants of the Podilsky Tovtry National Nature Park are presented. The alien fraction of the Park's flora comprises 335 species of vascular plants. Its taxonomic structure, ecological and life forms and species primary geographical origin are analyzed.

Key words: alien plants, Podilsky Tovtry National Nature Park, Ukraine

1. Introduction

By the end of the 20th century, invasions of alien plants were widely recognized as one of the major threats to biodiversity on the global scale. At present, in Ukraine, alien species are found in almost all types of semi-natural and natural plant communities and ecosystems and the process of their expansion and naturalization progresses rapidly (Protopopova 1991; Protopopova *et al.* 2002).

The plant cover of different areas belonging to the natural-preservation fund of Ukraine is prone to the invasion of alien plant species. The spread of some highly invasive taxa is a serious threat to the Ukrainian most valuable and unique flora and vegetation, like e.g. the Podilski Tovtry National Nature Park.

Since long time, the flora and vegetation of the Podilski Tovtry National Nature Park has been subject to studies by various researchers, such as: Besser (1822), Andrzejowski (1823), Belke (1859), Rogovich (1868), Schmalhausen (1886), Paczosky (1910), Krutskevych (1937, 1961), Makowiecki (1939), Kuznetsova (1953), Moroz (1978), Kukovytsa (1973), Zaverukha (1985), Lyubinska *et al.* (1999), Kovtun (2002) and Kagalo *et al.* (2003, 2004). However, the alien fraction of the flora has not been investigated so far.

The aim of the present study was to analyze the alien plants of the Podilsky Tovtry National Nature Park.

2. Study area

The Podilski Tovtry National Nature Park (PTNNP) is situated in the Khmelnytsky Region, including Kamyanets-Podilsky, Gorodok, and Chemeryvtsi Districts (Fig. 1). The area of the Park is 261 316 ha. The Park was founded in 1996 with the purpose of conservation, restoration and rational use of natural landscapes of Podillya and its unique historical-cultural complexes. These landscapes and complexes have aesthetic, scientific, recreational, medicinal and environmental protection value. The territory of the PTNNP is the core area of the Ukrainian National and European ECONET. It comprises the Dniester river corridor and two wetland areas of international importance: the Lower Smotrych River and Bakotska bay. The Park represents unique nature of the Ukrainian Pre-Dniester region - the southwest border of the Central Europe. It is distinguished by the presence of many rare, relict and endemic plant and animal species which are included in the Red List of IUCN (2010a), European Red List (2010b) and Bern Convention (1979).

The following functional zones can be distinguished on the territory of the Park: nature reserve zone, zone of controlled and stationary recreation and economical zone. Today, natural vegetation occupies no more than 17% of the Park's area, while agricultural landscape – 56.6 % and urban landscape – 15.1%.

Fig. 1. Location of the Podilski Tovtry National Nature Park in Ukraine

3. Material and methods

Our investigations were based on the original materials obtained during field studies in the different regions of the PTNNP in 1996–2008, as well as on herbarium materials and literature data. They involved an analysis of the Park's alien flora taxonomic structure (according to the Tolmachev classification 1974), ecological forms (after Didukh 2000) and life forms (after Raunkiaer 1934), species geographic origin, time of immigration, degree of naturalization and distribution and frequency of occurrence (common, rare, sporadic) (Prokudin et al. 1987).

The herbarium collections of the PTNNP, Kamyanets-Podilsky Botanical Garden, Ivan Ogiyenko Kamyanets-Podilsky National University, M. G. Kholodny Institute of Botany, National Academy of Sciences of Ukraine (KW) and Institute of Ecology of Carpathians, NAS of Ukraine (LWKS) were used in the study.

The terminology and classification of alien species is after Kornaś (1968), modified by Protopopova (1991). The following categories were used: colonophytes (epoecophytes limited to one or several stable populations in the area, with little or no trend toward further expansion), ephemeralophytes (non-naturalized, occasional immigrants, casuals or waifs), epoecophytes (naturalized in human-made and disturbed habitats) and agriophytes (naturalized in natural and seminatural habi-

tats). Phytosociological relevés were made according to the Braun-Blanquet method (1964), modified by Solomakha (2008). The nomenclature of vascular plants follows the Checklist of vascular plants of Ukraine (Mosyakin & Fedorovichuk 1999).

4. Results and discussion

The flora of the PTNNP is represented by 1543 species of vascular plants (Lyubinska et al. 1999). According to our data, the total list of the alien fraction of the Park's flora comprises 335 species of vascular plants from 226 genera and 68 families (Appendix) or 21.7% of the total number of vascular species. As compared with other reserves and parks of Ukraine, it is characterized by higher number of alien taxa. This results from a large share of agricultural fields in the Park's territory in the past and numerous settlements and recreation grounds at present.

Depending on the time of immigration of alien species to the Park, they can be divided into archaeophytes (125 spp.) and kenophytes (210).

The 10 leading families of the Park's alien flora (according to Tolmachev classification) are: Asteraceae (46 spp.), Brassicaceae (38), Poaceae (26), Fabaceae (20), Lamiaceae (19), Rosaceae (15), Chenopodiaceae (14), Boraginaceae, Apiaceae (10), Solanaceae (8), Scrophulariaceae (7); other families comprise from one

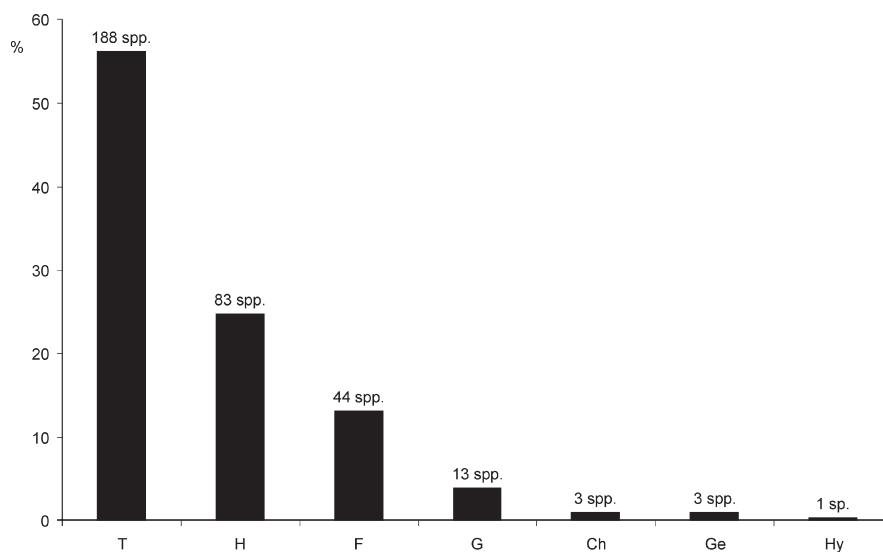

Fig. 2. Participation of different life forms in the alien flora of the Podilsky Tovtry National Nature Park

Explanations: T – terophytes, H – hemicryptophytes, F – phanerophytes, G – geophytes, Ch – chamaephytes, Ge – geophytes, Hy – hydrophytes

to five species (Appendix). The spectrum of these families is very similar to the spectrum of alien fraction of the whole Ukrainian flora (Protopopova 1991). Among leading genera are: *Amaranthus* and *Chenopodium* (8 species each), *Euphorbia* (6), *Papaver*, *Centaurea*, *Bromus* and *Geranium* (4 each); other genera consist of one to three species.

The dominant life form (according to the Raunkiaer's classification) are terophytes which are represented by 188 species. The spectrum of life forms represented in the alien flora of the Park is similar to other regional alien floras and the whole Ukrainian flora (Fig. 2).

It was established that among ecological forms prevail submesophytes (xeromesophytes) (198 spp.), followed by mesophytes (84) and subxerophytes (mesoxerophytes) (40). Other groups (hydrophytes and subhy-

drophytes) include from one to four species (Fig. 3).

In the mode of species origin predominate Mediterranean taxa (77 spp.), followed by North American (50), Asian (49), Mediterranean-Iran-Turanian (43) and European (34); other regions are poorly represented (Appendix).

In terms of the degree of species naturalisation prevail epoecophytes (187 spp.), followed by ephemero-phytes (55), colonophytes (48), ergasiophytes (27) and agriophytes (18) (Fig. 4). The stable component of this group (epoecophytes, agriophytes, and colonophytes) is represented by 252 species and the unstable one (ergasiophytes and ephemetrophytes) by 82 species.

The most important group in the Park's flora are agriophytes. Among them prevail terophytes, mesophytes and species of North American origin. They occupy different types of anthropogenic, semi-natural

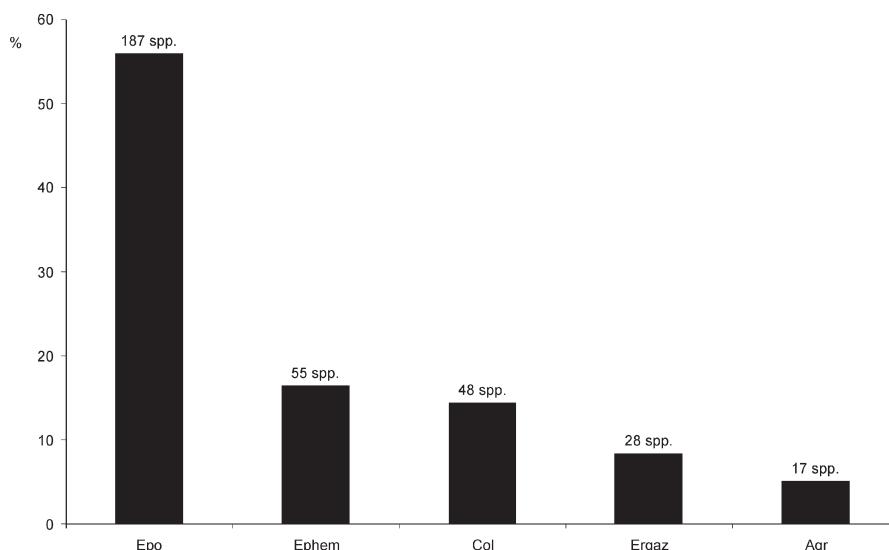

Fig. 4. Participation of the different sub-fractions of non-native plants according to the degree of their naturalization in the alien flora of the Podilsky Tovtry National Nature Park
Explanations: Epo – epoecophytes, Ephem – ephemeroephyses, Col – colonophytes, Ergaz – ergaziophytes, Agr – agriophytes

and natural habitats (Table 1), but majority of them grow in meadow-steppe ecotypes.

At present, the process of anthropogenic changes of flora and vegetation in natural habitats progresses rapidly. Many alien species are not only a stable component of these habitats, but also form communities in which they dominate. Particularly, a great influence on the structure of plant communities exert invasive species. Some invasive plants in the Park's territory, e.g. *Acer negundo* and *Phalacroloma annuum*, have been recorded in different types of habitats, such as: anthropogenic ecotypes – ass. *Chelidonio-Acerion negundi* L. et A. Jsh. 1989 (*Robinetea*) and *Urtico-Aegopodietum*

(R. Tx. 1963) Oberd. 1964 (*Galio-Urticetea*), semi-natural – *Poo nemoralis-Salicetum albae* Shevcyk et V. Solomakha 1996 and *Myosotido palustris-Salicetum albae* Shevcyk et V. Solomakha 1996 (*Salicetea purpureae*), and natural – *Salvio nemorosae-Elytrigietum intermediae* Tyschenko 1996 and *Trifolia-Melampyretum nemorosi* Passarye 1967 (*Trifolio-Geranietea*). Moreover, *Phalacroloma annuum* has been noted also in anthropogenic ecotypes – in ass. *Impatiens parviflorae-Robinietum* Sofron 1962 (*Robinetea*) and *Lamio-Cornietum maculatae* Oberd. 1957 (*Artemisieta vulgaris*), seminatural – *Myosotido palustris-Salicetum albae* Shevcyk et V. Solomakha 1996 (*Salicetea purpu-*

reae) and *Eringio plani-Bromopsietum inermis* Shevchyk et V. Solomakha 1996 (*Molinio-Arrhenatheretea*), and natural ones: *Trifolia-Melampyretum nemorosi* Passarye 1967 (*Trifolio-Geranietea*) and *Trifolietum montani* Mirk. et al. 1983 (*Molinio-Arrhenatheretea*).

Some alien plants pose threat to the Park's native plant communities. They comprise, e.g. *Ailanthus altissima* L. – the species primarily found in seminatural habitats but also in natural ones. This tree produces abundant root sprouts that can develop into extensive thickets and displace native vegetation. The limestone communities with *Allium flavescens*, *A. montanum*, *A. podolicum*, *Aurinia saxatilis*, *Astragalus albidus*, *A. monspessulanus*, *Jurinea calcarea*, *Pulsatilla nigricans*, *Poa versicolor* and *Stipa pennata* have been destroyed (Didukh & Korotchenko 2003). The *Phalacroloma annuum* very intensively colonizes neglected agricultural land and roadsides, but it is observed also in limestone communities, meadows, steppe and at forest edges. During 1970-1990, foresters planted *Pinus sylvestris* in the steppe and limestone areas. This species has a high level of seed production and gives rise to numerous progeny now. It changes life conditions for native plants, e.g. for populations of *Pulsatilla grandis*, *P. nigricans* (Lyubinska 2009), *Adonis vernalis*, etc.

The territory of PTNNP consists of 3 administrative districts: Kamyaneets Podilsky, Chemirivtsi and Gorodok, characterized in the Table 2. Numerous automobile and railway roads, industrial and agricultural activities as well as the Dnister river and its seven tributaries contribute to the spread of alien plants in this region.

Migration of alien plants along roads and rivers results in formation of such plant communities as: *Impatiens glanduliferae-Convolvuletum sepium* (Moor

1958) Hilbig 1972, *Polygonetum cuspidati* (Moor 1958) Th. Müller et Görs 1969 ex Görs 1974, *Sicyo-Echino-cystietum lobatae* Fijałkowski 1978 ex Brzeg et M. Wojterska 2001, *Aegopodio-Reynoutrietum sachalinensis* Brzeg in Brzeg et M. Wojterska 2001, *Impatientetum parviflorae* Brzeg 1989 ex Borysiak 1994, *Stachyo sylvaticae-Impatientetum noli-tangere* Pass. 1967 ex Hilbig 1972, *Geranio phaei-Urticetum dioicae* Hadač et al. 1969, *Galio-Urticetea* Pass. 1967 em. Kopecky 1969 and *Urtico-Sambucetea* Doing 1962 em. Pass. 1968 in forests. Furthermore, fluctuations in water level

5. Conclusions

The natural ecosystems of the Podilski Tovtry National Nature Park are almost completely lost due to significant anthropogenic transformation. The main factors limiting restoration of native plant communities are cattle pasturing and, clearing of forests, steppe and meadow lands.

For the effective preservation of the whole biodiversity of plant cover, including rare species and components of unique plant communities, it is necessary to ensure urgent protection of habitats (biocenoses). The management plan for the Park includes such activities as: regulation of a hydrological regime, restoration of native biotopes, reintroduction of locally extinct plant species and establishment of a monitoring system. Monitoring of the Park's unique vegetation and flora was introduced for the first time in 2002 and involves controlling the condition of rare plants and plant communities by the Park's scientists. The monitoring data from the Park have been an important tool for the evaluation of forest management practices.

The high proportion of archaeophytes in the alien flora of the Podilski Tovtry National Nature Park re-

Table 2. Characteristics of the administrative regions of the Podilski Tovtry National Nature Park

Administrative district	Area in %	Inhabitants in %	% of alien species*
Kamyaneets Podilsky	58.8	76.8	100.0
Chemirivtsi	35.6	21.4	86.1
Gorodok	5.6	1.8	59.3

Explanation: * – the total number of the Park's alien vascular plant species = 335

1958) Hilbig 1972, *Polygonetum cuspidati* (Moor 1958) Th. Müller et Görs 1969 ex Görs 1974, *Sicyo-Echino-cystietum lobatae* Fijałkowski 1978 ex Brzeg et M. Wojterska 2001, *Aegopodio-Reynoutrietum sachalinensis* Brzeg in Brzeg et M. Wojterska 2001, *Impatientetum parviflorae* Brzeg 1989 ex Borysiak 1994, *Stachyo sylvaticae-Impatientetum noli-tangere* Pass. 1967 ex Hilbig 1972, *Geranio phaei-Urticetum dioicae* Hadač et al. 1969, *Galio-Urticetea* Pass. 1967 em. Kopecky 1969 and *Urtico-Sambucetea* Doing 1962 em. Pass. 1968 in forests. Furthermore, fluctuations in water level

flects the intense anthropogenic changes of plant cover in the past, while the high number of kenophytes proves that man-made environmental change proceeds rapidly at present. The presence of a large and permanent group of alien species in the Park indicates their stable status in the area.

Acknowledgements. I am grateful to anonymous reviewers and colleagues from the M. G. Kholodny Institute of Botany, National Academy of Sciences of Ukraine – Prof. Dr. Viera V. Protopopova, and Dr. Myroslav V. Shevera for their useful comments and help in preparation of the manuscript.
